Welcome!

We, the organizers and executive committees of the 2001 International Symposia on Smart Structures and Materials and on NDE for Health Monitoring and Diagnostics, welcome you. We think there are significant opportunities for mutually beneficial interactions between our two symposia. While our primary objectives are to foster communications across a variety of technical disciplines and to encourage the interaction of disparate groups representing theoretical and experimental research, design, and process and product development, we also hope to excite and inspire you through the plenary presentations and special conference talks addressing our theme of "Where Are We Going? – 21st Century Growth Opportunities."

Much progress has been made in the creation of structures that will continuously and actively monitor and optimize themselves and their performance through emulation of biological systems with their adaptive capabilities and their integrated designs. The symposium for Smart Structures and Materials emphasizes the multi-/inter-disciplinary nature of the field and provides in depth coverage of the most recent results in smart materials, sensing, actuation, communications, power, advanced signal processing, structural design methodologies, and system integration across a variety of applications.

The challenge of inspecting aging structures without impairing their usefulness has evolved and advanced technologies for nondestructive evaluation (NDE) and links with biological systems for revolutionary advances in these technologies are being explored. The NDE Health Monitoring and Diagnostics Symposium addresses the current status and future directions of NDE with respect to the testing and monitoring of high-use structures such as naval vessels; aircraft and airports; and civil structures such as dams, bridges, and highways. Also included in this NDE symposium are presentations on decision-making processes, such as when degradation requires repair or replacement; and possible methods for mitigation including practical technologies, instrumentation, techniques, and case studies.

Please join us along with hundreds of engineers and scientists from the military, commercial, and academic sectors to discuss these technologies and to initiate some collaborative interactions. These symposia provide a unique opportunity for interactions across an immense cross-section of work in these critical fields.

Whither Smart Materials?

Speaker: **Dr. Dennis M. Bushnell**, Chief Scientist NASA Langley Research Center

Smart materials research and, increasingly, applications have inhabited the technological landscape for over a decade. This presentation considers potential further developments during the next decades in the context of the continuing/emerging triple technological revolutions in information technology, biotechnology, and nanotechnology. As a bottom line, smart [Brilliant/"Living"] materials should inhabit the nexus of these ongoing revolutions and be totally transformed in the process along with, perhaps, the human species/society.

He is the author of 230 publications and has received the AIAA Sperry, Fluid and Plasma Dynamics, and Dryden Lectureship Awards. In addition he has given the Royal Aeronautical Society Lanchester and Wright Brothers Lectureships and the ICAS Guggenheim Lecture. A recipient of NASA Exceptional Scientific Achievement and Leadership Medals, Dr. Bushnell has 5 patents to his credit. Technical interests include flow modeling and control, advanced concepts, facilities, and propulsion across the speed range, and future warfare. Plenary Presentation

The Importance of Multidisciplinary Research in Achieving Technological Advances

Speaker: **Prof. Geof Tomlinson**, Univ. of Sheffield (UK)

Engineering is often described as being dull. Contrary to this, the physical sciences are often seen as exciting. Consider trying to excite someone by talking about fatigue failure due to crack growth compared with designing micro-machines using self assembly materials. There is a compromise which can deliver excitement, novelty and new developments, this being to bring together researchers and technologists from different disciplines such as Chemistry, Physics, Biology, Materials Science, Engineering etc to tackle fundamental problems. To make major advances in Science and engineering there is a clear role for multidisciplinarity. This presentation looks at the role of multidisciplinary research for future opportunities and considers 'what might be possible' in relation to solutions to fundamental science and engineering problems. Examples of the benefits of such an approach are given where the basic problem of improving the internal energy dissipation of polymeric materials is described.

Biography: Prof. Geof Tomlinson has received degrees including MSc, PhD, FIMechE, FRAeS, CEng, and FRSA. He obtained his PhD in 1979 from the University of Aston in Birmingham, UK, on the topic of "Modal Properties of Complex Structures including Nonlinear Effects". He has held Lecturer and Senior Lecturer positions at the University of Manchester (1979-1986) and was Professor of Mechanical Engineering at Heriot-Watt University in Edinburgh (1986-1989). In 1989 he became Professor of Engineering Dynamics as well as the Divisional Head at the University of Manchester. He became Professor and Head of the Department of Engineering Dynamics at the University of Sheffield in 1995. Prof. Tomlinson's current positions at the University of Sheffield (since 1999) include Head of the Dynamics Research Group, Research Director for the Engineering and Physical Sciences Division, Director of the Division of Aerospace Engineering, and Director of the Rolls-Royce UTC in Materials Damping Technology. He has published over 140 technical papers and contributed to four books.

NDE Emerging Technologies, Challenges, and Trends

Speaker: **Dr. Yoseph Bar-Cohen**

The field of NDE has evolved significantly in the last century reaching an advanced stage of maturity where standard NDE procedures are now applied to many areas of our lives. As we begin the new Millennium it is interesting to bookmark the accomplishments and identify the challenges and trends. Further, it can be useful to determine the technologies that can be affected by NDE concepts and methodologies and the technologies that can be used to enhance the current NDE capabilities.

Biography: Dr. Yoseph Bar-Cohen is a physicist specialized in ultrasonics and electroactive materials and mechanism. He is the Group Leader for the JPL's Nondestructive Evaluation and Advance Actuators (NDEAA) Technologies (<http://ndeaa.jpl.nasa.gov/>) and is the JPL Resident NDE Expert. He is also an Adjunct Professor at the University of California, Los Angeles (UCLA) and a Fellow of the American Society for Nondestructive Testing (ASNT). In 1991, he established the NDEAA Lab that led to a series of innovative concepts and mechanisms. Currently, he is responsible for developing ultrasonic NDE methods, real time sensing, geophysical probing techniques, piezoelectric motors, a piezoelectric pump, electroactive polymer actuators, and high power ultrasonic techniques. He discovered the leaky Lamb waves (LLW) and polar back-scattering in composite materials and co-developed the related NDE methods. He made over 210 publications, numerous presentations at national and international conferences, Chaired/CoChaired 7 Conferences, has 13-registered patents and editor of 2 books.

The State-of-the-Art of Intelligent Materials Research in Japan

Speaker: Dr. Norio Shinya, National Research Institute for Metals (Japan)

The concept of "Intelligent Materials" was created in 1989 by The Council for Aeronautics, Electronics and Other Advanced Technologies, Science and Technology Agency of the Japanese Government. By this definition, "Intelligent Materials" have three primitive functions—sensor, processor and actuator—and exhibit intelligence by combining their primitive functions. This concept bears a strong resemblance to that of "Smart Structures." Since the proposal of this Intelligent Materials concept twelve years ago, several national projects have been initiated to realize these materials. The primary research efforts in current projects are classified in the following four categories: (1) assembly technologies at the nanometer to micrometer scale; (2) sensor, processor, and actuator materials; (3) bio-related materials; and (4) adaptive structural materials. In this presentation some typical recent advances in these categories will be introduced. The following topics will also be addressed:

- Powder particles assembling technologies for fabrication of three-dimensionally controlled microstructures
- High quality shape memory alloys
- Bioactive ceramics
- Self-healing materials

Biography: Dr. Shinya graduated from The University of Waseda in 1967 with a Bachelor's degree in Metallurgy. He worked as a visiting researcher at Sheffield University in England from 1976-77. In 1985 he received his Doctor of Engineering degree in Materials Engineering from The University of Tokyo. Dr. Shinya is currently the Director of the Intelligent Materials Group at the National Research Institute for Metals in Japan. His research interests include assembly technologies, material damage and healing, and adaptive materials. He has published over 100 original articles and received special awards from The Iron and Steel Institute of Japan, The Japan Institute of Metals, and the Science and Technology Agency of the Japanese Government.

Plenary Presentation

Health Monitoring and Diagnostics of Civil Infrastructures

Speaker: Dr. Ken P. Chong, National Science Foundation

New construction is the largest industry in the world, amounting to 10% of the world's gross domestic product. Civil infrastructure systems are generally the most expensive investments/assets in any country (an estimated \$20 trillion in the United States), and these systems are deteriorating at an alarming rate. Additionally, the systems have long service life compared with any other kinds of commercial product and are rarely replaceable once they are erected. Yet the feedback on the "state of health" of constructed systems is practically non-existent. Reliable health monitoring including nondestructive evaluation is an essential part of this feedback and monitoring system for infrastructures. The goal of this presentation is to provide a summary of recent research activities that will act as a catalyst to expand interest in the development of new health monitoring technologies. The paper describes the motivation for developing innovative tools for monitoring the health of the nation's infrastructure. An overview of research projects sponsored by the National Science Foundation (NSF) as well as projects at NIST and FHWA to develop and apply new technologies is presented. The paper includes a review of state-of-the-art acoustic wave methods for the evaluation of structural materials and pavements, as well as new electromagnetic methods for corrosion monitoring. Finally, efforts to develop new technologies for the assessment of the nearly 500,000 bridges along the nation's roads and highways are described.

Biography: Ken P. Chong, F.ASCE, M. ASME, M.IEEE, PE, received his MSE and Ph.D. in engineering mechanics from Princeton University in 1969. His professional experience includes: Senior Project Engineer of R&D, National Steel Corporation, 1969-1974; professor and chairman of Structures/Solid Mechanics Group, University of Wyoming, teaching and research in Structural Mechanics and Solid Mechanics for 15 years. He has been a visiting professor at MIT, Houston, Washington and Hong Kong universities (honorary professor of HKU). Since 1989 he has been the director of Structural Systems and Construction Processes, and since 1999 in Mechanics and Materials at the National Science Foundation (NSF) where he formulates and administers the U.S. policy and research, educational programs in structures, construction, materials, engineering mechanics, NDE, CAD and KBES. As chair of the NSF Civil Infrastructure Systems Task Committee, 1992-93, he led the development of a major NSF-wide initiative which is changing the university culture in systems approaches and integration. He has published over 150 refereed technical papers and authored several books.
